Contents

Preface	xi
SCAN 2000 Keynote Address The Future of Intervals <i>G. William Walster</i>	1
Part I Software– and Hardware–Tools	
Variable-Precision Exponential Evaluation <i>Javier Hormigo, Julio Villalba, Michael J. Schulte</i>	19
Fast computation of some special integrals of mathematical physics <i>Ekatherina A. Karatsuba</i>	29
Interval Input and Output <i>Eero Hyvönen</i>	41
A Case for Interval Hardware on Superscalar Processors <i>James E. Stine, Michael J. Schulte</i>	53
Evaluating the Impact of Accurate Branch Prediction on Interval Software <i>Ahmet Akkas, Michael J. Schulte, James E. Stine</i>	69
Automatic Test Case Generation using Interval Arithmetic <i>Günter Schumacher, Armin Bantle</i>	81
Part II Linear Algebra	
On the Hull of the Solution Sets of Interval Linear Equations <i>Jana Konickova</i>	91
Computation of Algebraic Solutions to Interval Systems via Systems of Coordinates <i>Svetoslav Markov</i>	103
Towards Diagrammatic Analysis of Systems of Interval “Linear Equations” <i>Zenon Kulpa</i>	115

On the Solution of Parametrised Linear Systems <i>Evgenija D. Popova</i>	127
Part III Polynomials	
Verified solutions of systems of nonlinear polynomial equations <i>Daniela Fausten, Wolfram Luther</i>	141
Euler-like method with Weierstrass' correction <i>Miodrag S. Petkovic, Dejan V. Vranic</i>	153
Part IV Set Enclosures	
Guaranteed Set Computation with Subpavings <i>Michel Kieffer, Isabelle Braems, Éric Walter, Luc Jaulin</i>	167
A New Intersection Algorithm for Parametric Surfaces Based on LIEs <i>Katja Bühler, Wilhelm Barth</i>	179
State estimation using interval constraint propagation <i>Luc Jaulin, Isabelle Braems, Michel Kieffer, Éric Walter</i>	191
Part V Global Optimization	
Interval Methods for Global Optimization Using the Boxing Method <i>Andras Erik Csallner, Rudi Klatté, Dietmar Ratz, Andreas Wiethoff</i>	205
A Branch-and-Prune Method for Global Optimization <i>Dimitris G. Sotiropoulos and Theodoula N. Grapsa</i>	215
Simulation of a Controlled Aircraft Elevator under Sensor Uncertainties <i>Jürgen Heeks, Eberhard P. Hofer, Bernd Tibken, Karin Lunde, Klaus Thorwart</i>	227
Part VI Control	
Traditional parameter estimation versus estimation of guaranteed parameter sets <i>Eberhard P. Hofer, Bernd Tibken, Milan Vlach</i>	241
Stabilizing Control Design of Nonlinear Process Involving Uncertainties <i>Mikhail Krastanov, Neli Dimitrova</i>	255
Set Estimation, Computation of Volumes and Data Safety <i>Isabelle Braems, Michel Kieffer, Éric Walter, Luc Jaulin</i>	267

Part VII ODE and DAE and Applications

Verified High-Order Integration of DAEs and Higher-order ODEs 281
Jens Hoefkens, Martin Berz, Kyoko Makino

About a Finite Dimensional Reduction Method for Conservative Dynamical Systems and its Applications 293
Anatoliy Prykarpatsky, Stanislaw Brzychczy, V. Samoilenko

Verified Determination of Singularities in Chemical Processes 305
Christian H. Bischof, Bruno Lang, Wolfgang Marquardt, Martin Mönnigmann

Modeling of Multibody Systems with Interval Arithmetic 317
Christian Hörsken, Holger Traczinski

Part VIII Stochastics and Probability

On the Algebraic Properties of Stochastic Arithmetic. Comparison to Interval Arithmetic 331
Rene Alt, Svetoslav Markov

Global Random Walk Simulations of Diffusion 343
Calin Vamos, Nicolae Suciu, Harry Vereecken, Olaf Nitzsche, Horst Hardelauf

Interval Computations as a Particular Case of a General Scheme Involving Classes of Probability Distributions 355
Scott Ferson, Lev Ginzburg, Vladik Kreinovich, Harry Schulte

For reliable and powerful scientific computations 367
Fabienne Jézéquel, Jean-Marie Chesneaux

Reliable representations of strange attractors 379
Dominique Michelucci

Appendix: The Referees 391

Index 393

Preface

Scan 2000, the GAMM - IMACS International Symposium on Scientific Computing, Computer Arithmetic, and Validated Numerics and Interval 2000, the International Conference on Interval Methods in Science and Engineering were jointly held in Karlsruhe, September 19-22, 2000.

The joint conference continued the series of 7 previous Scan-symposia under the joint sponsorship of GAMM and IMACS. These conferences have traditionally covered the numerical and algorithmic aspects of scientific computing, with a strong emphasis on validation and verification of computed results as well as on arithmetic, programming, and algorithmic tools for this purpose.

The conference further continued the series of 4 former Interval conferences focusing on interval methods and their application in science and engineering. The objectives are to propagate current applications and research as well as to promote a greater understanding and increased awareness of the subject matters.

The symposium was held in Karlsruhe the European cradle of interval arithmetic and self-validating numerics and attracted 193 researchers from 33 countries. 12 invited and 153 contributed talks were given. But not only the quantity was overwhelming we were deeply impressed by the emerging maturity of our discipline. There were many talks discussing a wide variety of serious applications stretching all parts of mathematical modelling. New efficient, publicly available or even commercial tools were proposed or presented, and also the foundations of the theory of intervals and reliable computations were considerably strengthened.

Hence, a possible subdivision of this book might have been according to the following headlines:

- strengthen the theory
- improve the tools
- perform applications

Another observation is that the talks were concerned not only with developing enclosure methods, but also transferred the mechanisms and design process

known from these areas to other fields. And, of course, there were new applications of well known enclosure methods.

The 31 contributions to this proceedings volume were carefully selected out of a much larger number of submissions. A thorough referee process has been installed, and we take the opportunity to thank all the referees for their detailed comments delivered in time.

The book opens with a historical review and an outline of the coming perspectives of intervals and reliable computations by G.W. Walster. In the first section, then, efficient algorithms for elementary functions and hardware devices are considered. The section is finished by an article that shows how the principles of enclosure methods can be applied in test strategies for scientific computations.

The second section deals with the solution of linear systems. Surprisingly enough that all the authors consider a kind of generalized arithmetic.

The treatment of polynomial equations and the sharp enclosure of sets, although difficult tasks in their own, may be considered as two of the basic ingredients for two traditional application areas: global optimization and control theory. Hence, the four topics are presented in this order.

Solutions of differential equations that model dynamic processes are the topic of the next 4 papers.

The final section is devoted to the treatment of uncertain data, in particular the relation of interval and stochastic methods is investigated.

A final "Dankeschön" to Ulrich Kulisch and the organizing committee of the symposium. We further thank all those people who helped with the publication of the proceedings, the authors, the referees, the early subscribers and the technical staff, in particular Markus Grimmer.

About the enclosed CD

The enclosed CD ROM contains a full set of the latest version of Sun's ForteTM Developer 6 update 2 compilers and productivity tools which supports Interval Arithmetic in both Fortran 95 and C++. A 30-day trial set of license tokens can be obtained at no cost and if you decide to purchase the product, reinstallation of the software is unnecessary.

Forte Developer 6 software is an outstanding solution for software development on the SolarisTM Operating Environment for both individuals and teams of software developers. It is a comprehensive, integrated, development environment that helps you build high-performance, reliable, scalable, open, applications more rapidly and efficiently with GUI- and CLI-based tools. Interval Arithmetic is supported as a native data type in Fortran 95 and as a class library in C++.
